Optimal Control

#### PID Control

Optimization

Camaluaiana

## Introduction

- Tremendous Development
- Private sector, not just military
- Autonomy
- FAA policy for commercial applications (2015)
- Rapid growth of a multi-billion dollar industry

> Edward Kemper

#### Introduction

Model

Optimal Control

#### PID Conti

PID Gain Optimization

Conclusion

### Motivation

- Energy management is a pervasive engineering problem
- Quad-rotors have very high energy demand
- Multi-rotor systems are entirely thrust driven
- Instability = Maneuverability = High energy

Edward Kemper

#### Introduction

Model

Optimal Control

#### PID Cont

PID Gain Optimizatior

Conclusions

## Prior Work

- energy optimization and trajectory planning of fixed wing UAVs
- quad-rotors
  - basic stability
  - attitude and position control
  - · dynamical model
- Classical Optimal Control is a long story

Edward Kemper

#### Introduction

Model

Classical Optimal Control

PID Control

PID Gain Optimization

Conclusions

## **Problem Statement**

We wish to find a set of control expressions for a quad-rotor UAV which minimizes the energy expended in flying between two known points by optimizing the path.

> Edward Kemper

#### Introduction

Model

Classical Optimal Control

#### PID Control

PID Gain

Conclusions

## **Problem Statement**

### Assumptions:

- the flight path that will be optimized is free of obstacles
- only modeled environmental variables
- model of the system derived from a Euler-Lagrange formulation

> Edward Kemper

#### Introduction

Model Model

Classical Optimal Control

PID Cont

PID Gain Optimization

Conclusion:

### Problem Statement

### Classical Optimal Control Approach:

- control of the system and the optimization are represented in a single mathematical formulation
- Solving the optimal control problem is achieved by solving a boundary value problem
- Most literature deals with linear systems

> Edward Kemper

#### Introduction

Model

Classical Optimal Control

#### PID Control

PID Gain Optimization

Conclusion:

## Problem Statement

### Heuristic approach:

- PD gives attitude control
- PID gives position control
- this provides a platform for simulation
- the optimization procedure evaluates the results of these simulations for optimality as a function of the PID gains used in the position control expressions

> Edward Kemper

Introductio

Dynamic Model

Optimal Control

PID Contro

PID Gain Optimization

Conclusions

# Dynamic Model

- We must understand the mathematical relationships between the control input and the resulting dynamics of the system
- Euler-Lagrange formulation

Edward Kemper

Introduction

Dynamic Model

Classical Optimal Control

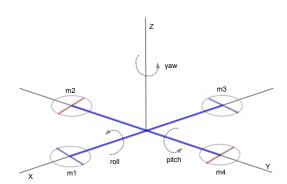

PID Cont

PID Gain Optimization

Conclusion

# Dynamic Model

- $\bullet$   $\psi$  is the yaw angle around the z-axis
- ullet heta is the pitch angle around the y-axis
- ullet  $\phi$  is the roll angle around the x-axis

Edward Kemper

Introductio

Dynamic Model

Classical Optimal Control

PID Cont

PID Gain Optimization

Conclusions

# Dynamic Model

The rotor angular velocities are related to the forces they produce by:

$$f_i = k\omega_i^2 \tag{1}$$

> Edward Kemper

Introduction

Dynamic Model

Classical Optimal Control

PID Control

PID Gain Optimization

Conclusions

# Dynamic Model

In the quad-rotor frame of reference, the motors produce torques on the system.

$$\boldsymbol{\tau}_{B} = \begin{bmatrix} \tau_{\phi} \\ \tau_{\theta} \\ \tau_{\psi} \end{bmatrix} = \begin{bmatrix} lk(-\omega_{2}^{2} + \omega_{4}^{2}) \\ lk(-\omega_{1}^{2} + \omega_{3}^{2}) \\ \sum_{i=1}^{4} b\omega^{2} \end{bmatrix}$$
(2)

> Edward Kemper

Introduction

Dynamic Model

Classical Optimal Control

FID COILIOI

PID Gain Optimization

# Dynamic Model

The combined thrust of the rotors in the direction of the quad-rotor frame z axis is  $T_B = [0, 0, T]^T$  where,

$$T_B = \sum_{i=1}^4 f_i \tag{3}$$

•

> Edward Kemper

Introduction

Dynamic Model

Classical Optimal Control

PID Con

PID Gain

Conclusions

# Dynamic Model

In the inertial frame, the kinetic and potential energy of the system are given by

$$T_{\mathsf{trans}} = \frac{1}{2} m \dot{\xi}^{\mathsf{T}} \dot{\xi} \tag{4}$$

$$T_{\rm rot} = \frac{1}{2} \dot{\eta}^T J \dot{\eta} \tag{5}$$

$$U = mgz. (6)$$

The Lagrangian is formed as the difference between kinetic and potential energy.

> Edward Kemper

Introduction

Dynamic Model

Classical Optimal Control

PID Control

PID Gain Optimization

Conclusion

# Dynamic Model

The dynamics of the system are represented by the Euler - Lagrange differential equations of motion.

$$\frac{d}{dt} \left( \frac{\delta L}{\delta \dot{q}} \right) - \frac{\delta L}{\delta q} = F \tag{7}$$

$$q = [x, y, z, \psi, \theta, \phi]^{\mathsf{T}} = [\xi, \eta]^{\mathsf{T}}.$$
 (8)

$$\xi = [x, y, z]^T, \quad \eta = [\psi, \theta, \phi]^T$$
(9)

> Edward Kemper

Introductio

Dynamic Model

Classical Optimal Control

PID Control

PID Gain Optimization

Conclusion:

# Dynamic Model

The linear components of the generalized forces produce the following equations.

$$f = RT_B = m\ddot{\xi} - G \tag{10}$$

The angular components are expressed as

$$\ddot{\eta} = J^{-1} \big( \tau_b - C(\eta, \dot{\eta}) \dot{\eta} \big) \tag{11}$$

> Edward Kemper

Introduction

Dynamic Model

Classical Optimal Control

PID Conti

Optimization

Conclusions

# Classical Optimal Control

### We Define:

- Performance index (Lagrangian)  $L[q(t), u(t), t] = u^T I u$
- Constraint equations are the system equations of motion
- The Hamiltonian  $H = L(q(t), u(t), t) + \lambda(t)^{T} (F(q(t), u(t), t))$
- The full objective function can be written as

$$\mathcal{J} = \nu^T \Psi(q(t_f), t_f) + \int_{t_0}^{t_f} H(q(t), u(t), t) - \lambda^T \ddot{q} dt \qquad (14)$$

Edward Kemper

Classical Optimal Control

PID Conti

PID Gain Optimization

C . . . . l. . . . . . . . . .

# The Shooting Method

### the algorithm:

- solving the set of differential equations as an initial value problem
- measuring the error in the final state of the system compared to the desired final state
- Advantages
  - straightforward iterative quadrature method and error minimization
- Disadvantages
  - does not always converge, subject to the stability of the differential equations in question

Edward Kemper

Introduction

Dynan Model

Classical Optimal Control

PID Cont

PID Gain Optimizatio

Conclusions

### The Finite Difference Method

- create a system of algebraic equations at each instance in time where the solution is desired
- derivatives in the differential equations are expressed as finite differences
- The values of each state and co-state variable are defined as unknowns at each time step
- thousands of equations and unknowns
- Advantages
  - turns the BVP into a system of algebraic equations
  - easy to solve for linear system
- Disadvantages
  - hard to solve for nonlinear system
  - does not always converge

> Edward Kemper

Introductio

Model

Classical Optimal Control

PID Cont

PID Gain Optimization

Conclusion

### **Decision Time**

The BVP takes too long to solve so we must find another way! A Heuristic Method

- Control of the system achieved with PID expressions
- Optimization achieved by appropriately manipulating PID gains in order to change the system behavior
- Quantify system behavior with performance metrics

> Edward Kemper

Introductio

Model

Classical Optimal Control

PID Control

PID Gain Optimization

Conclusion

## PID Control

- PID controllers for the x, y, and z directions
- PD controllers for each of the Euler angles  $(\phi, \theta, \psi)$
- Assume process noise and measurement noise are zero

Edward Kemper

Introductio

Dynan Model

Classical Optimal Control

PID Control

PID Gain Optimizatio

Conclusions

### PID Control

### PID Control Algorithm

- The position control expressions give 'commanded' linear accelerations
- 2 The necessary total thrust, pitch, and roll are determined.
- 3 The commanded torques are given by PD controllers using the commanded yaw, pitch, and roll as angular set points.
- 4 The motor speeds can then be determined.
- **6** The system model can be used to obtain the updated state of the system.
- 6 Repeat.

PID Gain Optimization

Lonclusion:

# Our Heuristic Optimization Method

- We aim to find:  $argmin[\sum_{k,i} \omega_i[k] \mid K_p, K_i, K_d]$
- $\omega_i[k]$  is the *ith* rotor speed at the *kth* time step
- The variables  $K_p$ ,  $K_i$  and  $K_d$  are the vectors of proportional, integral, and derivative gains respectively

> Edward Kemper

Introductio

Model

Optimal Control

PID Gain

PID Gain Optimization

Conclusion

### Heuristic Method

In reality, there are other important performance criteria

- over-shoot of the desired location
- the time of flight
- marginal instabilities

### Heuristic Method

### An Algorithm for Optimization

- 1 Choose a set of proportional and derivative gains for each vector direction (x,y, and,z),
- Perform a simulation that controls the quad-rotor from an initial vector position to a desired vector position
- 3 Calculate the sum of the four motor speeds over the duration of the simulation
- 4 Appropriately change the PID gains such that the sum of the motor speeds decreases
- **6** Go to step 1. Repeat until the sum of the motor speeds is found to be a minimum.

Classica Optima Control

PID Contr

PID Gain Optimization

Optimization

conclusion

### Heuristic Method

The relationship between the measured total thrust and PID gains is not well behaved!!

- NO steepest descent
- Needed a deeper understanding of the relationship between PID gains and performance metrics
- Try brute force approach: manually create a look-up table of PID gains v.s. measured metrics

Edward Kemper

Introductio

Model Model

Classical Optimal Control

FID COILIO

PID Gain Optimization

Conclusion

### Heuristic Method

first attempt at creating a lookup table:

- Need to reduce the number of gain variables in the procedure
- Use the set point [0,0,1] so that x and y controllers are irrelevant
- Ziegler-Nichols PID tuning method allows for PID gains to be expressed as a function of  $k_u$
